Package

epiregulon 1.0.23

Contents

1	Load regulon	2
2	Load scRNA-seq data	2
3	Calculate activity	3
4	Perform differential activity	3
5	Visualize activity	4
6	Pathway enrichment	10
7	Session Info	13

Epiregulon also supports transcription factor activity inference when users only have scRNA-seq. After all, multiome or scATAC-seq data is still relatively rare. To enable TF activity inference on scRNA-seq, users can supply a pre-constructed gene regulatory network. [Dorothea](#) provides both human and mouse pre-constructed gene regulatory networks based on curated experimental and computational data. In this vignette, we bypass the regulon construction step and go straight to calculate TF activity from a Dorothea GRN.

1 Load regulon

Dorothea assigns confidence level to its regulons with A being the most confident (i.e. supported by multiple lines of evidence) and E being the least confident.

```
library(dorothea)
data(dorothea_mm, package = "dorothea")
regulon <- dorothea_mm

#known tf's
genes_to_plot <- c("Foxa1", "Neurod1", "Pdx1", "Arx")
```

2 Load scRNA-seq data

We download the raw counts of a mouse pancreas data set from [scRNAseq](#). We add normalized logcounts, perform dimension reduction and visualize the embeddings using [scater](#).

```
library(scRNAseq)
## Warning: multiple methods tables found for 'acbind'
## Warning: multiple methods tables found for 'arbind'
library(scater)

sce <- BaronPancreasData('mouse')
sce <- logNormCounts(sce)
sce <- runPCA(sce)
sce <- runUMAP(sce)

plotUMAP(sce, colour_by = "label", text_by = "label")
```

3 Calculate activity

Even though Dorothea provides weights under the `mor` column, we achieved superior performance if we recompute the weights based on the correlation between `tf` and target gene expression based on our own data. We performed 2 steps, the first step is to add weights to the Dorothea regulons and the second step is to estimate the TF activity by taking the weighted average of the target gene expression.

```
library(epiregulon)

#Add weights to regulon
regulon.ms <- addWeights(regulon = regulon,
                        expMatrix = sce,
                        clusters = sce$label,
                        BPPARAM = BiocParallel::MulticoreParam())

#Calculate activity
score.combine <- calculateActivity(sce,
                                regulon = regulon.ms,
                                mode = "weight",
                                method = "weightedMean")
```

4 Perform differential activity

```
markers <- findDifferentialActivity(activity_matrix = score.combine,
                                groups = sce$label,
```

```
pval.type = "some",  
direction = "up",  
test.type = "t")
```

Take the top TFs

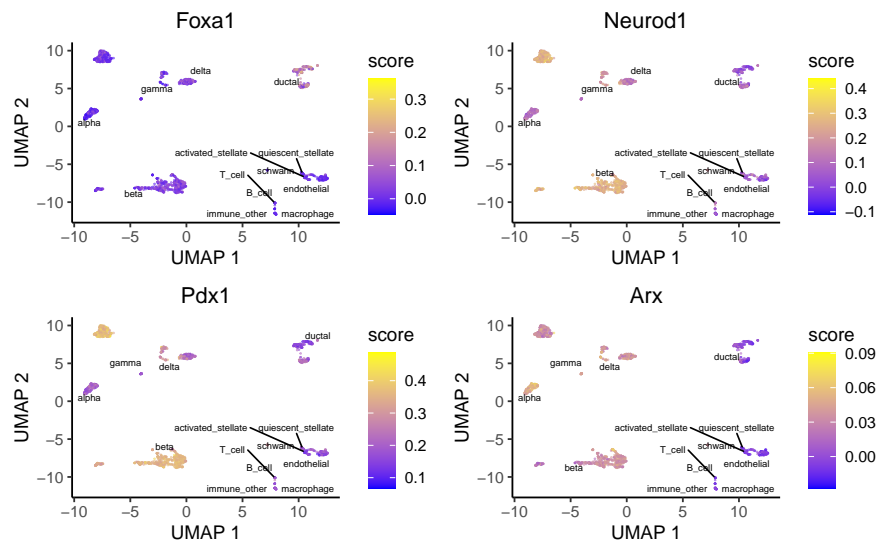

```
markers.sig <- getSigGenes(markers, topgenes = 5 )  
## Using a logFC cutoff of 0.1 for class B_cell  
## Using a logFC cutoff of 0.1 for class T_cell  
## Using a logFC cutoff of 0.1 for class activated_stellate  
## Using a logFC cutoff of 0.1 for class alpha  
## Using a logFC cutoff of 0.1 for class beta  
## Using a logFC cutoff of 0.1 for class delta  
## Using a logFC cutoff of 0.1 for class ductal  
## Using a logFC cutoff of 0.1 for class endothelial  
## Using a logFC cutoff of 0.1 for class gamma  
## Using a logFC cutoff of 0.1 for class immune_other  
## Using a logFC cutoff of 0.1 for class macrophage  
## Using a logFC cutoff of 0.1 for class quiescent_stellate  
## Using a logFC cutoff of 0.1 for class schwann
```

5 Visualize activity

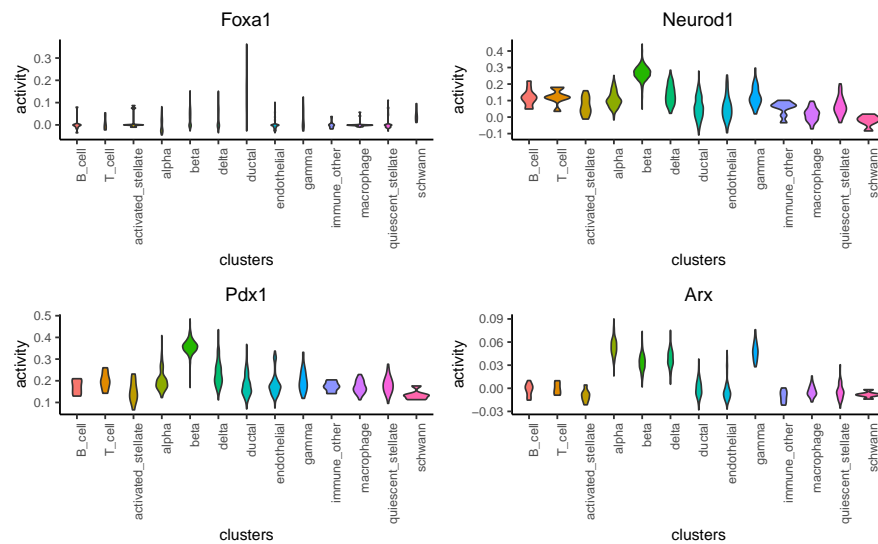

Finally we visualize the TF activity by either UMAP, violin plots or bubble plots. We confirm the activity of known lineage factors Pdx1 and Neurod1 in beta cells, Arx in alpha cells and Foxa1 in ductal cells.

```
# plot umap  
plotActivityDim(sce = sce,  
  activity_matrix = score.combine,  
  tf = genes_to_plot,  
  legend.label = "score",  
  point_size = 0.1,  
  dimtype = "UMAP",  
  label = "label",  
  combine = TRUE,  
  text_size = 2)
```

Dorothea tutorial

```
# plot violin plot
plotActivityViolin(score.combine,
  tf = genes_to_plot,
  clusters = sce$label)
```

```
# plot bubble plot
plotBubble(score.combine,
  tf = genes_to_plot,
  clusters = sce$label)
```

Dorothea tutorial

Plot bubble plot of differential TFs

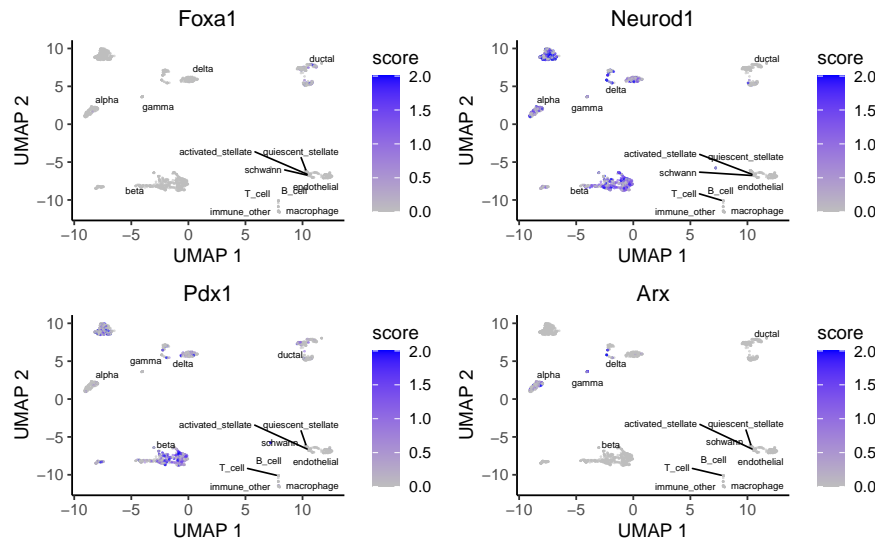

```
plotBubble(score.combine,  
           tf = markers.sig$tf,  
           clusters = sce$label)
```

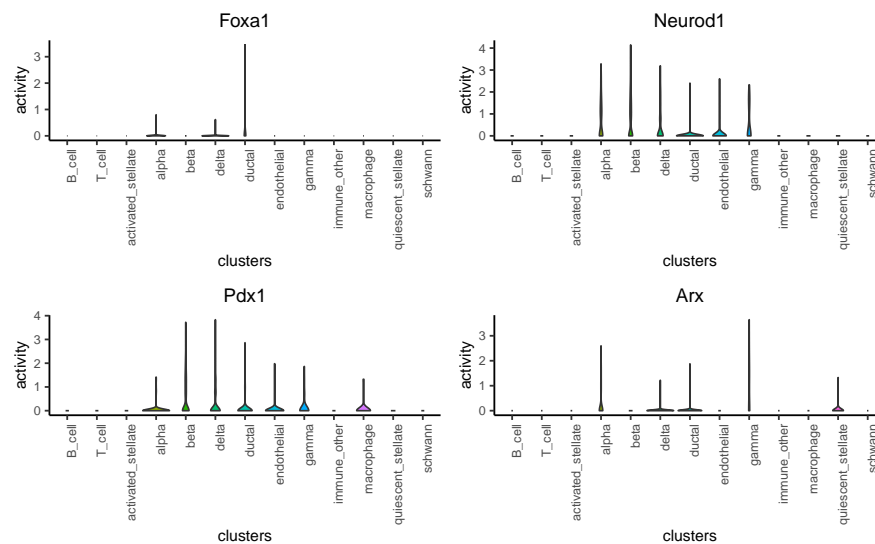

We can adapt the `epiregulon` package to plot gene expression. When compared against TF activity, gene expression of `Foxa1` and `Arx` has noisy signals and high dropout rates. `Epiregulon` enhances the signal to noise ratio of TF activity and better resolves lineage differences.

```
# plot umap
plotActivityDim(sce = sce,
  activity_matrix = logcounts(sce),
  tf = genes_to_plot,
  legend.label = "score",
  point_size = 0.1,
  dimtype = "UMAP",
  label = "label",
  combine = TRUE,
  text_size = 2,
  colors = c("gray", "blue"),
```

```
limit = c(0,2))
```

```
# plot violin plot
plotActivityViolin(logcounts(sce),
  tf = genes_to_plot,
  clusters = sce$label)
```

```
# plot Bubble plot
plotBubble(logcounts(sce),
  tf = markers.sig$tf,
  clusters = sce$label)
```

We can visualize the target genes for transcription factors of interest

```
plotHeatmapRegulon(sce=sce,
                    tfs=genes_to_plot,
                    regulon=regulon.ms,
                    regulon_cutoff=0.5,
                    downsample=1000,
                    cell_attributes="label",
                    col_gap="label",
                    exprs_values="logcounts",
                    name="regulon heatmap",
                    column_title_rot = 45)
```

```
plotHeatmapActivity(activity_matrix = score.combine,
                    sce=sce,
                    tfs=genes_to_plot,
                    downsample=1000,
                    cell_attributes="label",
                    col_gap="label",
                    name="regulon heatmap",
                    column_title_rot = 45)
```

6 Pathway enrichment

Sometimes it is useful to understand what pathways are enriched in the regulons. We take the highly correlated target genes of a regulon and perform geneset enrichment using the `enricher` function from [clusterProfiler](#).

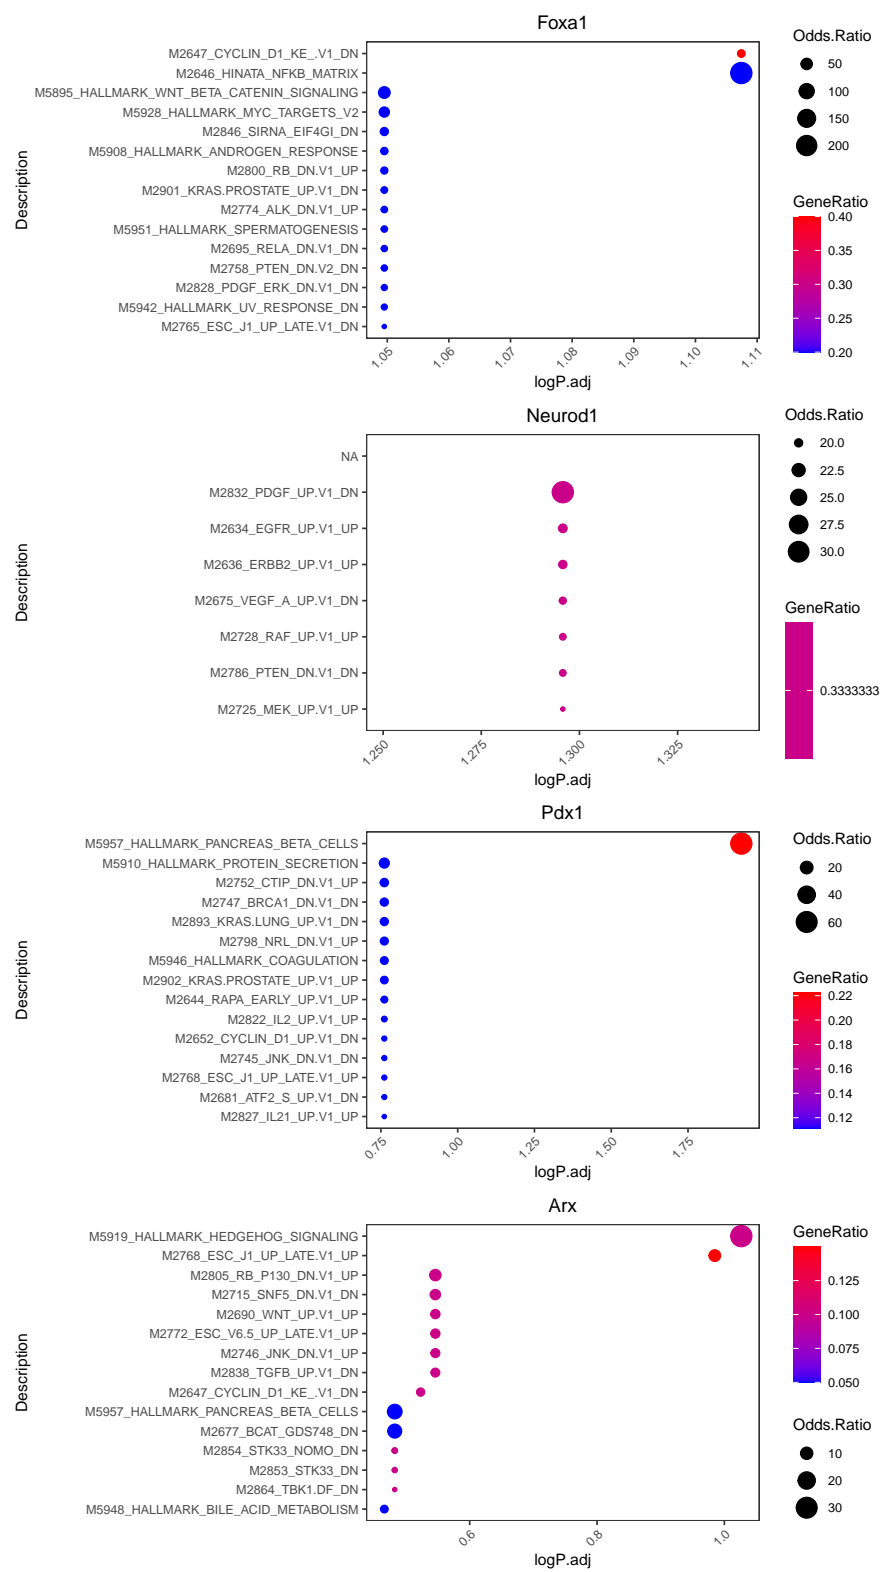

```
#retrieve genesets
H <- EnrichmentBrowser::getGenesets(org = "mmu", db = "msigdb", cat = "H", gene.id.type = "SYMBOL", cache = 1)
C6 <- EnrichmentBrowser::getGenesets(org = "mmu", db = "msigdb", cat = "C6", gene.id.type = "SYMBOL", cache = 1)

#combine genesets and convert genesets to be compatible with enricher
gs <- c(H,C6)
gs.list <- do.call(rbind,lapply(names(gs), function(x)
  {data.frame(gs = x, genes = gs[[x]])}))
```

Dorothea tutorial

```
enrichresults <- regulonEnrich(genes_to_plot,  
                              regulon = regulon.ms,  
                              weight = "weight",  
                              weight_cutoff = 0.5,  
                              genesets = gs.list)  
  
## Foxa1  
##  
## Neurod1  
## Pdx1  
## Arx  
  
#plot results  
enrichPlot(results = enrichresults, ncol = 1)
```

Dorothea tutorial
